1 Geometry

1.1 Basics

```
#pragma once
double eps = 1e-6;
typedef complex<double> point;
struct circle {
    point c;
    double r;
    circle(point c = {}, double r = 0): c(c), r(r) {}
};
double cross(point a, point b) { return imag(conj(a) * b); }
double dot(point a, point b) { return real(conj(a) * b); }
```

1.2 Area of intersection of two circles

```
#include "Basics.cpp"
double circ_inter_area(circle &a, circle &b) {
    double d = abs(b.c - a.c);
    if(d <= b.r - a.r) return a.r * a.r * M_PI;
    if(d <= a.r - b.r) return b.r * b.r * M_PI;
    if(d >= a.r + b.r) return 0;
    double alpha = acos((a.r * a.r + d * d - b.r * b.r) / (2 * a.r * d));
```

```

double beta = acos((b.r * b.r + d * d - a.r * a.r) / (2 * b.r * d));
return a.r * a.r * (alpha - 0.5 * sin(2 * alpha)) + b.r * b.r * (beta
↪ - 0.5 * sin(2 * beta));
}

```

1.3 Points of intersection of two circles

```

#include "Basics.cpp"
// Intersects two circles and intersection points are in 'inter'
// -1-> outside, 0-> inside, 1-> tangent, 2-> 2 intersections
int circ_circ_inter(circle &a, circle &b, vector<point> &inter) {
    double d2 = norm(b.c - a.c), rS = a.r + b.r, rD = a.r - b.r;
    if(d2 > rS * rS) return -1;
    if(d2 < rD * rD) return 0;
    double ca = 0.5 * (1 + rS * rD / d2);
    point z = point(ca, sqrt(a.r * a.r / d2 - ca * ca));
    inter.push_back(a.c + (b.c - a.c) * z);
    if(abs(z.imag()) > eps) inter.push_back(a.c + (b.c - a.c) * conj(z));
    return inter.size();
}

```

1.4 Line-circle intersection

```

#include "Basics.cpp"
// Intersects (infinite) line a-b with circle c
// Intersection points are in 'inter'
// 0 -> no intersection, 1 -> tangent, 2 -> two intersections
int line_circ_inter(point a, point b, circle c, vector<point> &inter) {
    c.c -= a;
    b -= a;
    point m = b * real(c.c / b);
    double d2 = norm(m - c.c);
    if(d2 > c.r * c.r) return 0;
    double l = sqrt((c.r * c.r - d2) / norm(b));
    inter.push_back(a + m + l * b);
    if(abs(l) > eps) inter.push_back(a + m - l * b);
    return inter.size();
}

```

1.5 Line-line intersection

```

#include "Basics.cpp"
// Intersects point of lines a-b and c-d
// -1->coincide,0->parallel,1->intersected(inter. point in 'p')
int line_line_inter(point a, point b, point c, point d, point &p) {
    if(abs(cross(b - a, d - c)) > eps) {
        p = cross(c - a, d - c) / cross(b - a, d - c) * (b - a) + a;
        return 1;
    }
}

```

```

if(abs(cross(b - a, b - c)) > eps) return 0;
return -1;
}

```

1.6 Segment-segment intersection

```

#include "Line-line intersection.cpp"
// Intersect of segments a-b and c-d
// -2 -> not parallel and no intersection
// -1 -> coincide with no common point
// 0 -> parallel and not coincide
// 1 -> intersected ('p' is intersection of segments)
// 2 -> coincide with common points ('p' is one of the end
// points lying on both segments)
int seg_seg_inter(point a, point b, point c, point d, point &p) {
    int s = line_line_inter(a, b, c, d, p);
    if(s == 0) return 0;

}

```

6.3 Simplex

*/*The LP should be in standard maximization form.*
maximize: <c,x>
*subject to: A*x ≤ b, x ≥ 0*
Use global variables A, b, and c.
If n = # vars, m = # constraints (apart from nonnegativity) then

A : m by n constraint matrix
b : m-dimensional array of constants in the constraints
c : n-dimensional array of coefficients in the objective function
Once A, b, and c are constructed, simply call simplex(n, m).
Returns: -1 == unbounded, 0 == infeasible, 1 == optimum solution found
If an optimum is found: x = one such optimum, val = its value
(x and val are global variables)
*Running time: $O(n * m * I)$ where I = # iterations. In the worst case*
*this can be exponential, but it is usually *much* better. Can probably*
*be used safely in a programming contest where $n*m \sim 10,000$.*
This is just a heuristic statement.
Uses Bland's pivot selection rule to avoid cycles.
CAUTION:
 - Many loops go from 0 up to *and including* n or m. But some do not.
 Pay careful attention toward the inequalities used.
 - Make sure you adjust MAXN and MAXC appropriately. */

```

        sat++;
    }
}
return ans;
}

```

6.7 Cubic equation solver

```

// Solves  $ax^3 + bx^2 + cx + d = 0$ 
vector<double> solve_cubic(double a, double b, double c, double d) {
    long double a1 = b / a, a2 = c / a, a3 = d / a;
    long double q = (a1 * a1 - 3 * a2) / 9.0, sq = -2 * sqrt(q);
    long double r = (2 * a1 * a1 * a1 - 9 * a1 * a2 + 27 * a3) / 54.0;
    double z = r * r - q * q * q, theta;
    vector<double> res;
    res.clear();
    if(z <= 0) {
        theta = acos(r / sqrt(q * q * q));
        res.push_back(sq * cos(theta / 3.0) - a1 / 3.0);
        res.push_back(sq * cos((theta + 2.0 * M_PI) / 3.0) - a1 / 3.0);
        res.push_back(sq * cos((theta + 4.0 * M_PI) / 3.0) - a1 / 3.0);
        return res;
    }
    double v = pow(sqrt(z) + fabs(r), 1 / 3.0);
    v += q / v;
    v *= (r < 0) ? 1 : -1;
}

```

```

v -= a1 / 3.0;
res.push_back(v);
return res;
}

```

6.8 Alpha-beta pruning

```

int inf = 1e9;
struct state {
    int score() { return 0; } // TODO
    vector<state> children() { return {}; } // TODO
};
int ab(state s, int alpha = -inf, int beta = inf, int player = 1) {
    auto ch = s.children();
    if(ch.size() == 0) return s.score() * player; // if terminal
    int value = -inf;
    for(state c: ch) { // try best moves first!
        value = max(value, -ab(c, -beta, -alpha, -player));
        alpha = max(alpha, value);
        if(alpha >= beta) break;
    }
    return value;
}

```

6.9 Unbounded maximum stack size

```

#include <sys/resource.h>
void remove_stack_size_limit() {
    struct rlimit rl;
    getrlimit(RLIMIT_STACK, &rl);
    rl.rlim_cur = RLIM_INFINITY;
    setrlimit(RLIMIT_STACK, &rl);
}

```

6.10 Formulas

Pick's Theorem: $A = i + \frac{b}{2} - 1$ (A : area, i : interior, b : boundary points)

Catalan numbers: $C_n = \frac{1}{n+1} \binom{2n}{n} = \frac{4i-2}{i+1} C_{n-1} = \sum_{i=0}^{n-1} C_i C_{n-1-i}, C_0 = 1$

Triangle: $c^2 = a^2 + b^2 - 2ab \cos(\theta_c)$, $s = \frac{1}{2}(a+b+c)$, inradius = $\sqrt{\frac{(s-a)(s-b)(s-c)}{s}}$,
 exradii_a = $\sqrt{\frac{s(s-b)(s-c)}{s-a}}$

Spherical cap: $V = \frac{\pi h}{6}(3a^2 + h^2)$, $A = 2\pi r h$ (a : radius of base of cap, r : radius of sphere, h : height of cap)

Probability of either: $\mathbb{P}(A \cup B) = \mathbb{P}(A) + \mathbb{P}(B) - \mathbb{P}(A \cap B)$

Probability of both: $\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B \mid A)$

Bayes' formula: $\mathbb{P}(A \mid B) = \frac{\mathbb{P}(B \mid A)\mathbb{P}(A)}{\mathbb{P}(B)}$

6.11 Submission Checklist

- First to solve is worth nothing, wrong answer costs 20 minutes
- Ensure tests achieve 100% code coverage
- At least 2 people must independently understand the problem statement
- At least 2 people must understand the solution
- Anything in the statement that you don't understand the importance of?

Preventing WA

- Make some tricky test cases!
- Edge cases?
- How much precision do you need?

Preventing Crashes

- Compile with `-Wall -Wextra`
- Divide by zero? Negative sqrt? Inverse trig domain?

Preventing TLE

- Stack overflow?
- Infinte loop?
- Make sure you actually use the DP table
